# Sustainably Unlocking the Economic Potential of Lake Turkana

World Food Programme

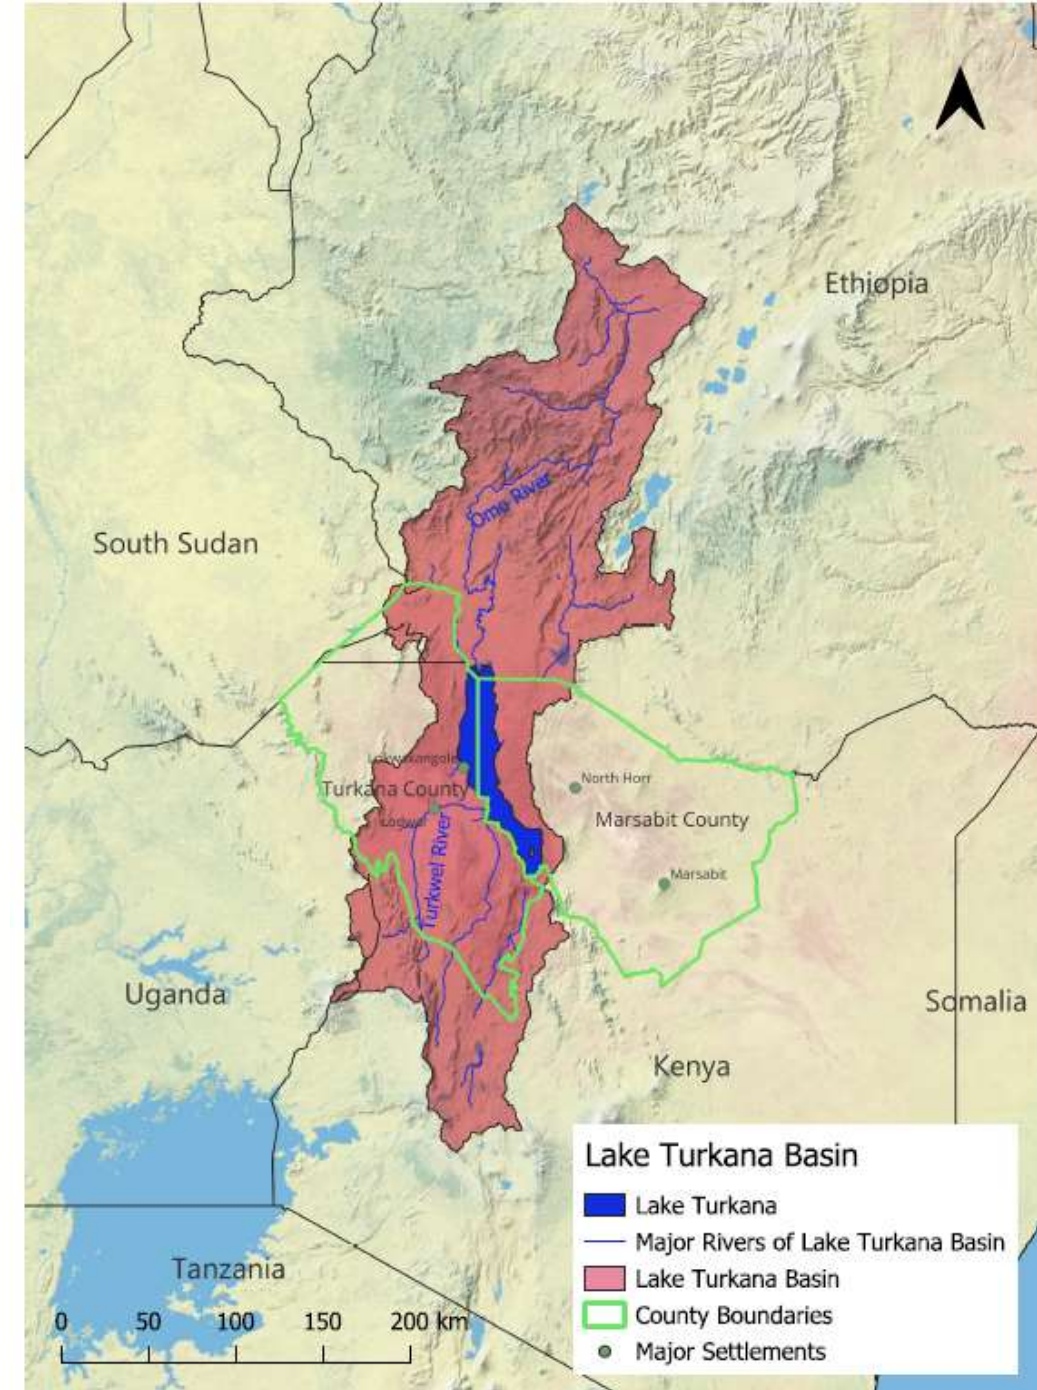

unesco

# Background

- World's largest permanent desert lake
- Supports 500,000 people living within the basin
- Transboundary between Kenya and Ethiopia
- Seasonal and annual fluctuations (many “unknowns”)
- Economic Analysis Study revealed 14M Euro/year loss due to lack of adequate fish value chain (cold chain + fish processing)
- One of the highest level of malnutrition
- Recent draughts impacted lives and livelihood
- 10+ years timeframe in two phases – first phase 2024-28)

# Climate-resilient livelihoods, conflict and social dynamics

# Nutrition and role of fish

# Economic potential – market linkages

# Water and energy

## Vision and approach

*A systems approach that puts Lake Turkana at the heart of boosting the fish value chain, for resilient livelihoods, food and nutrition security and stability in Marsabit and Turkana Counties.*

# Building blocks/pillars

Integrated water  
resource/lake  
management

Climate-resilient  
livelihoods and  
fish value chain

Nutrition and  
food security

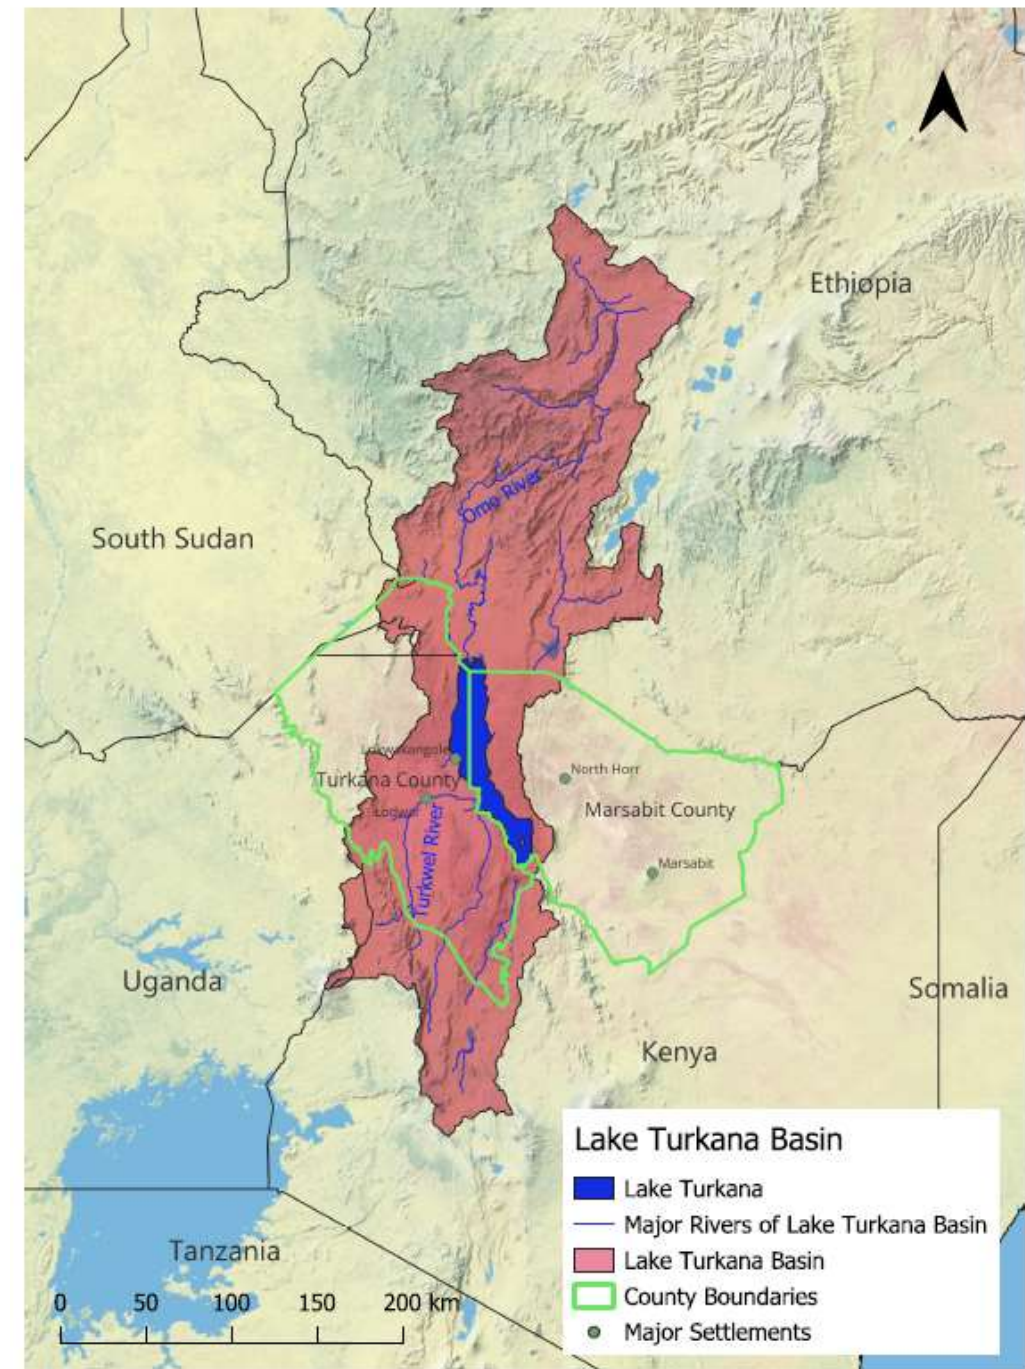

Climate - Conflict sensitivity - Community engagement – Inclusion

# Pillar 1: Integrated Water Resources Management

## Objective:

To develop the necessary knowledge base of the natural resource of the lake that will support decision making on future investments in fisheries and prioritization of water resources management strategies for water security and the protection of the lake ecosystem

# PILLAR 1 - METHODOLOGY

**Development of a DSS for IWRM for lake ecosystem and sustainable livelihoods**

**1. CRIDA (Climate Risk Informed Decision Analysis)** for ecosystem-based water resources management planning

**2. Assessment of surface and groundwater resources** and their management & water balance

**4. UNESCO World Water Quality Portal for L. Turkana-** for monitoring quality and water level dynamics through earth observations

**3. Household/Individual Water Insecurity Experiences (HWISE/IWISE).**

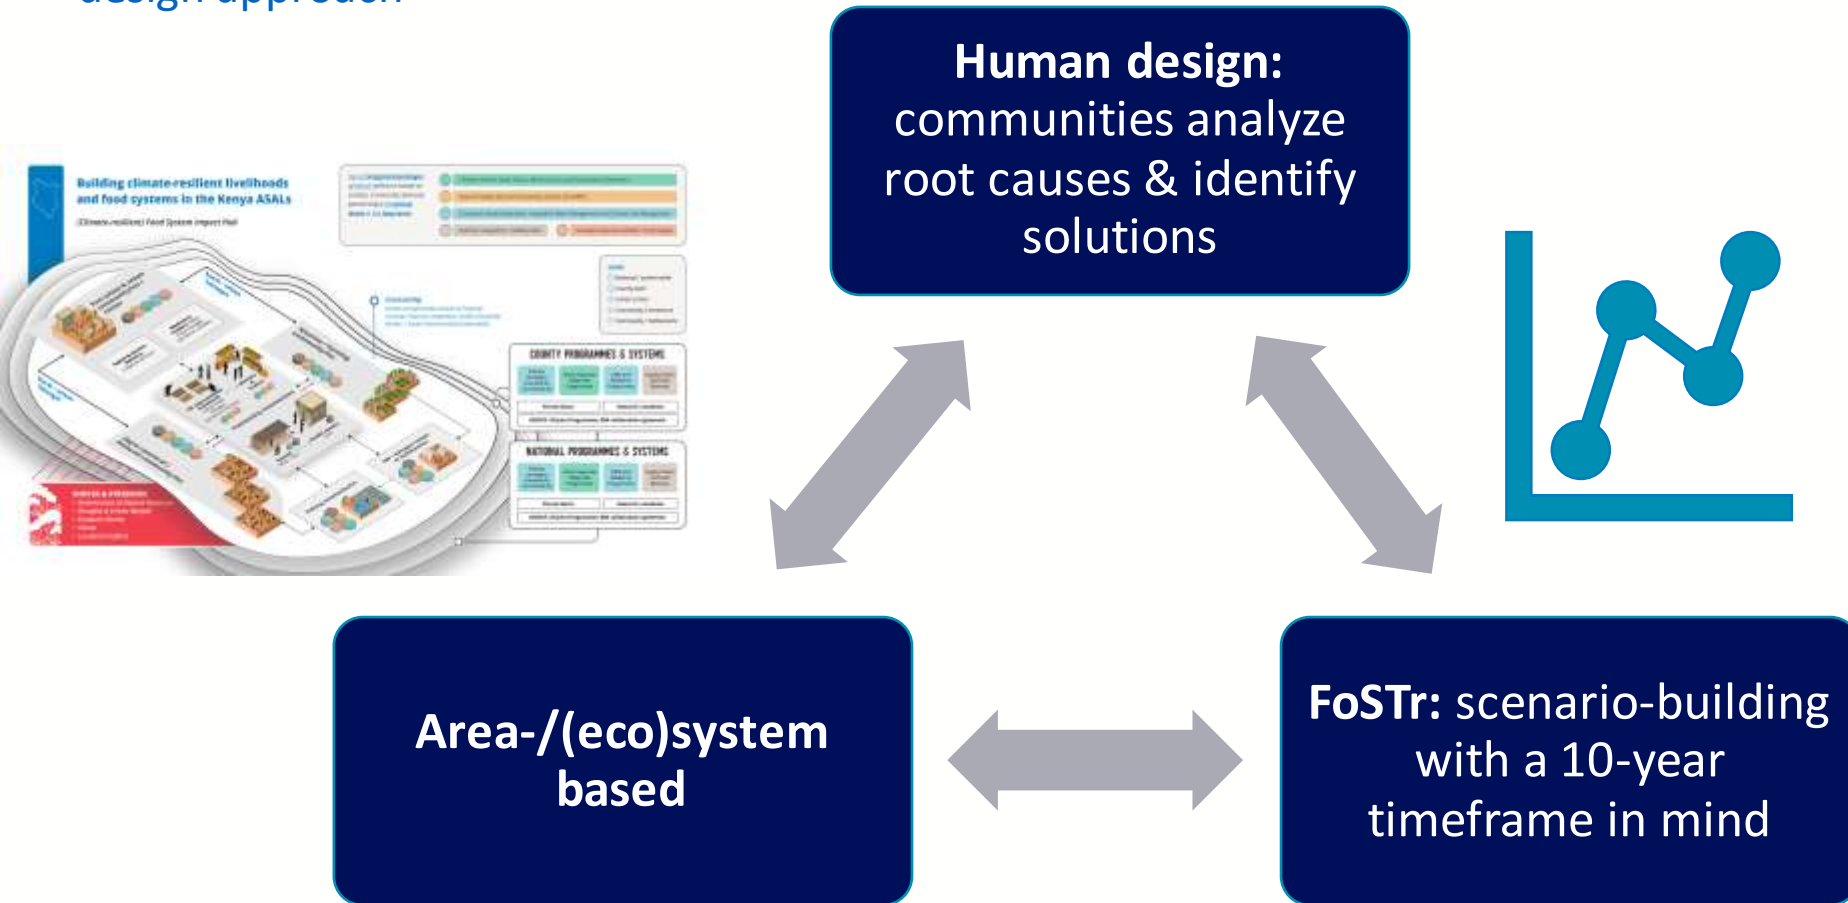

**5. Fish productivity** model based on lake dynamics and environmental factors

- Understanding Lake's **fish production capacity** through fisheries assessment and monitoring programme of the key ecological structure of the lake.

## PILLAR 2 & 3 - METHODOLOGY

Guided by the methodology developed by the [Foresight for Food Systems Transformation \(FoSTr\)](#) Programme combined with [WFP Kenya's area-based food systems](#) and [human-centred design approach](#)

# Studies (Inception Phase - 2024)

## UNESCO

- Experimental fishing and acoustic surveys
- Water security index
- Transboundary water resources data gap analysis

## WFP

- Fish value chain systems analysis
- Root causes of malnutrition and fish consumption study
- Climate security, conflict and gender analysis

## TABLE OF CONTENT

# PROMOTING A JUST TRANSITION TO GREEN HYDROGEN IN AFRICA

## OVERALL PROJECT PRESENTATION

Co-funded by  
the European Union

The project is supported by the Clean Hydrogen Partnership and its members  
Hydrogen Europe and Hydrogen Europe Research

# PROJECT INTRODUCTION, MOTIVATION AND OBJECTIVES

## OVERALL OBJECTIVE

Develop mutual benefit joint  
green hydrogen roadmaps

# UNIQUE AFRICAN HYDROGEN VALUE PROPOSITION

- **Huge Renewable Potential** (and already presence of large amount of RES power plant whose production capacity is not fully exploited – LCOH: 1.5-2.5 €/kg)
- **Presence of Gas Infrastructure** (in the North of the continent – Cost of transport: 0.2-0.25 €/kg)
- **Presence of Hard to Abate industries** (chemical industry to produce ammonia for fertilisers, followed by refining for hydrocracking and the desulphurisation of fuels – lacking of high efficient local SMR plants)
- **African focal position in many shipping routes**
- **Presence of Natural Hydrogen Reservoirs** (still to be technologically explored)

**Technical potential for producing green hydrogen under USD 1.5/kg by 2050, in TWh<sup>[1]</sup>**

Co-funded by  
the European Union

# JUST GREEN AFRH2ICA YEAR ONE KEY RESULT

**AFRICAN AND EUROPEAN ROADMAPS TOWARDS HYDROGEN TRANSITION:  
HOW TO MUTUALLY SUPPORT AND BENEFIT**

*Stefano Battisti, Federico Tassoni, Amanda P. Mwanuzi, Mohamed Shams*

<https://www.enerka.eu/en/publications/afrih2ica-report>

Third edition: Final Report / December 2022, 114 pages, 1.1 MB, English, PDF

**INTRODUCTION**

In a world of 10 billion people, the need for energy is growing. Hydrogen is a key element in the energy transition, and its production and use will be crucial for the EU energy transition. The report provides a comprehensive overview of the hydrogen market in Africa and Europe, and its potential for growth. It also highlights the challenges and opportunities for the hydrogen market in Africa and Europe, and provides recommendations for the future.

Country	Hydrogen Production Potential (TWh/yr)	Hydrogen Production Cost (€/TWh)
Egypt	1.5	1.5
South Africa	1.5	1.5
Kenya	1.5	1.5
Algeria	1.5	1.5
Morocco	1.5	1.5
Tunisia	1.5	1.5
Nigeria	1.5	1.5

**QUESTION 1: can Africa produce green hydrogen and export it to Europe?**

Africa has a high potential to produce green hydrogen, and its production cost is competitive with Europe. However, the export of green hydrogen from Africa to Europe is still a challenge, as it requires a high level of infrastructure and investment.

**QUESTION 2: where is hydrogen demand in Africa?**

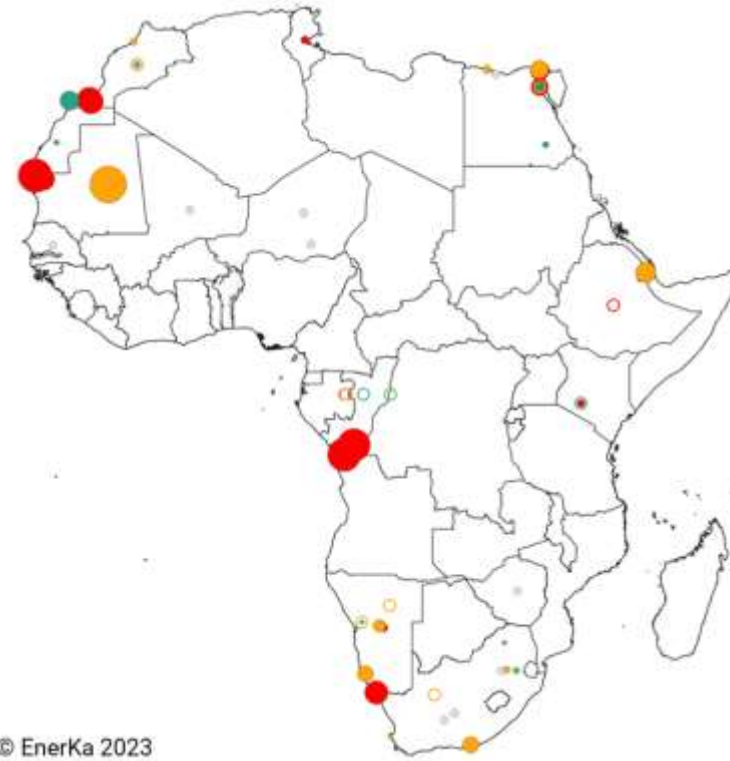

Hydrogen demand in Africa is concentrated in the industrial sector, particularly in the production of fertilizers and chemicals. However, there is also a growing demand for hydrogen in the transport sector, particularly in the form of hydrogen fuel cells.

**QUESTION 3: where is hydrogen demand in Europe?**

Hydrogen demand in Europe is concentrated in the industrial sector, particularly in the production of fertilizers and chemicals. However, there is also a growing demand for hydrogen in the transport sector, particularly in the form of hydrogen fuel cells.

**QUESTION 4: where is hydrogen demand in Africa?**

Hydrogen demand in Africa is concentrated in the industrial sector, particularly in the production of fertilizers and chemicals. However, there is also a growing demand for hydrogen in the transport sector, particularly in the form of hydrogen fuel cells.

Size proportional to annual production output

- 100% Domestic
- Predominantly domestic
- Predominantly export
- 100% export
- Unknown capacity

# THE HYDROGEN HOTSPOT APPROACH

- Different role of Electrolysers from EU (not for RES penetration and grid stability): large «off-grid» RES plants fully dedicated to local low carbon H<sub>2</sub> production
- Projects that must be bankable without any feed-in or not looking at electric market revenues
- In Africa it is more difficult to identify (and most of the time create) a systemic energy/H<sub>2</sub> demand and then there would be a need of higher investments (e.g. Difficulty in setting up a «FCH Transport» value chain from scratch)
- Lack of energy infrastructure supporting the setup of «off-grid» large RES plants
- **WATER AVAILABILITY**

# THE HYDROGEN HOTSPOT APPROACH

## *Area to be modelled in the project*

- **NORTHERN AFRICA:** Morocco (Dakhla – Laayoune area, Tangiers area, Jorf Lasfar area...)
- **CENTRAL/WESTERN AFRICA:** Kenya (Rift Valley Geothermal Area, Nairobi Capital City Area. Mombasa/Tanzania Borders area...)
- **WEST AFRICA:** Ghana/Togo area (SekyereEast District, Accra, Lomé and Sokodé – Tema Port area)
- **SOUTHERN AFRICA:** South Africa (Goega Industrial Park, Saldanha Bay, Boegoebaai Bay), Namibia (Swakopmund))

**WHAT TO BE MODELLED:** RES potential, **WATER AVAILABILITY**, techno-economics and electrolyser/storage sizing, EU energy grid impact, sustainability assessment

# Does the Green Hydrogen Economy Have a Water Problem?

**Global** freshwater withdrawal and consumption of three different sectors:

- fossil fuel energy production and power generation
- Agriculture
- the implementation of a global hydrogen economy.

Based on 9kg water consumed/kg H<sub>2</sub>

Consumed: water converted into another unusable form or not returned to original water body

→ **limiting factor for electrolyzers is not Water supply, but energy efficiency of electrolyzers.**

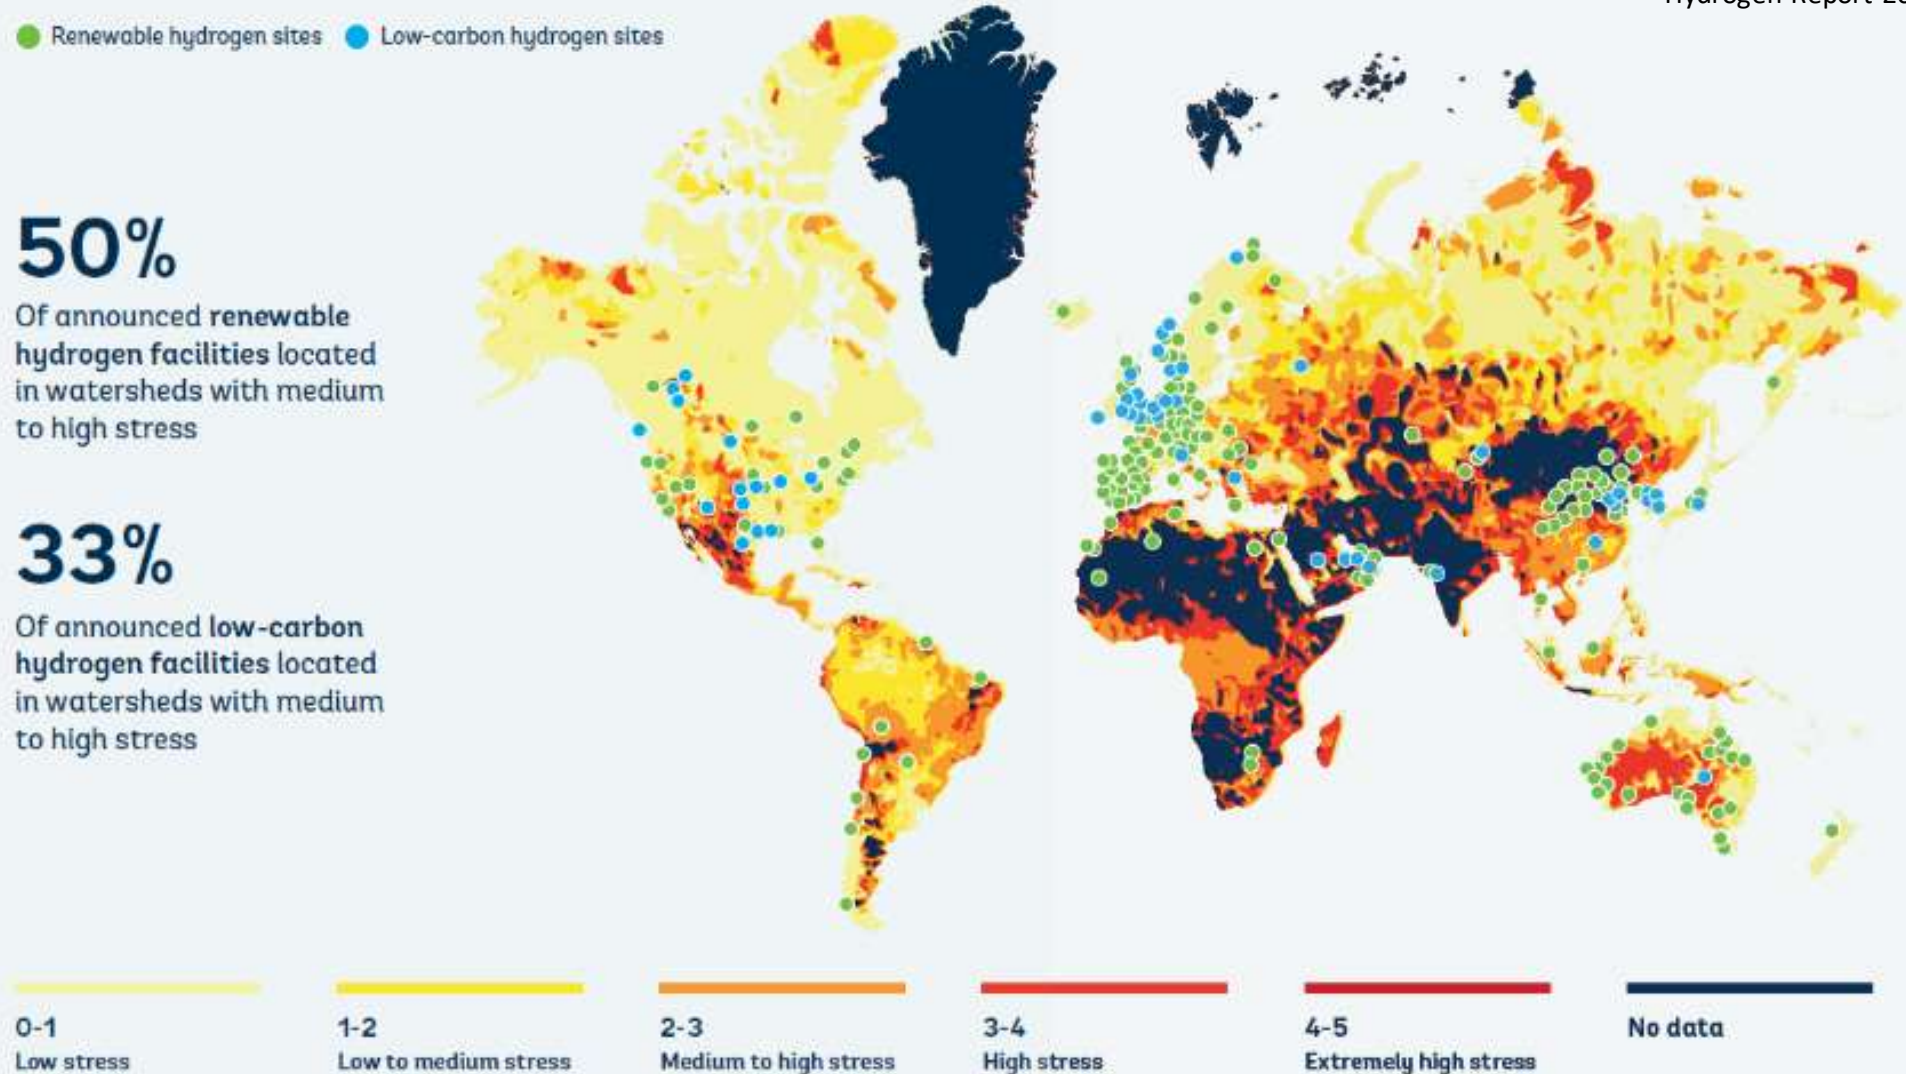

(ACS Energy Lett. 2021, 6, 9, 3167-3169)

# Challenges of the location of hydrogen production projects in regions with water scarcity

Figure 18: Announced low-carbon and renewable hydrogen locations, and 2020 watershed stress

Hydrogen-Report-2022 [hydrogencouncil](https://hydrogencouncil.com)

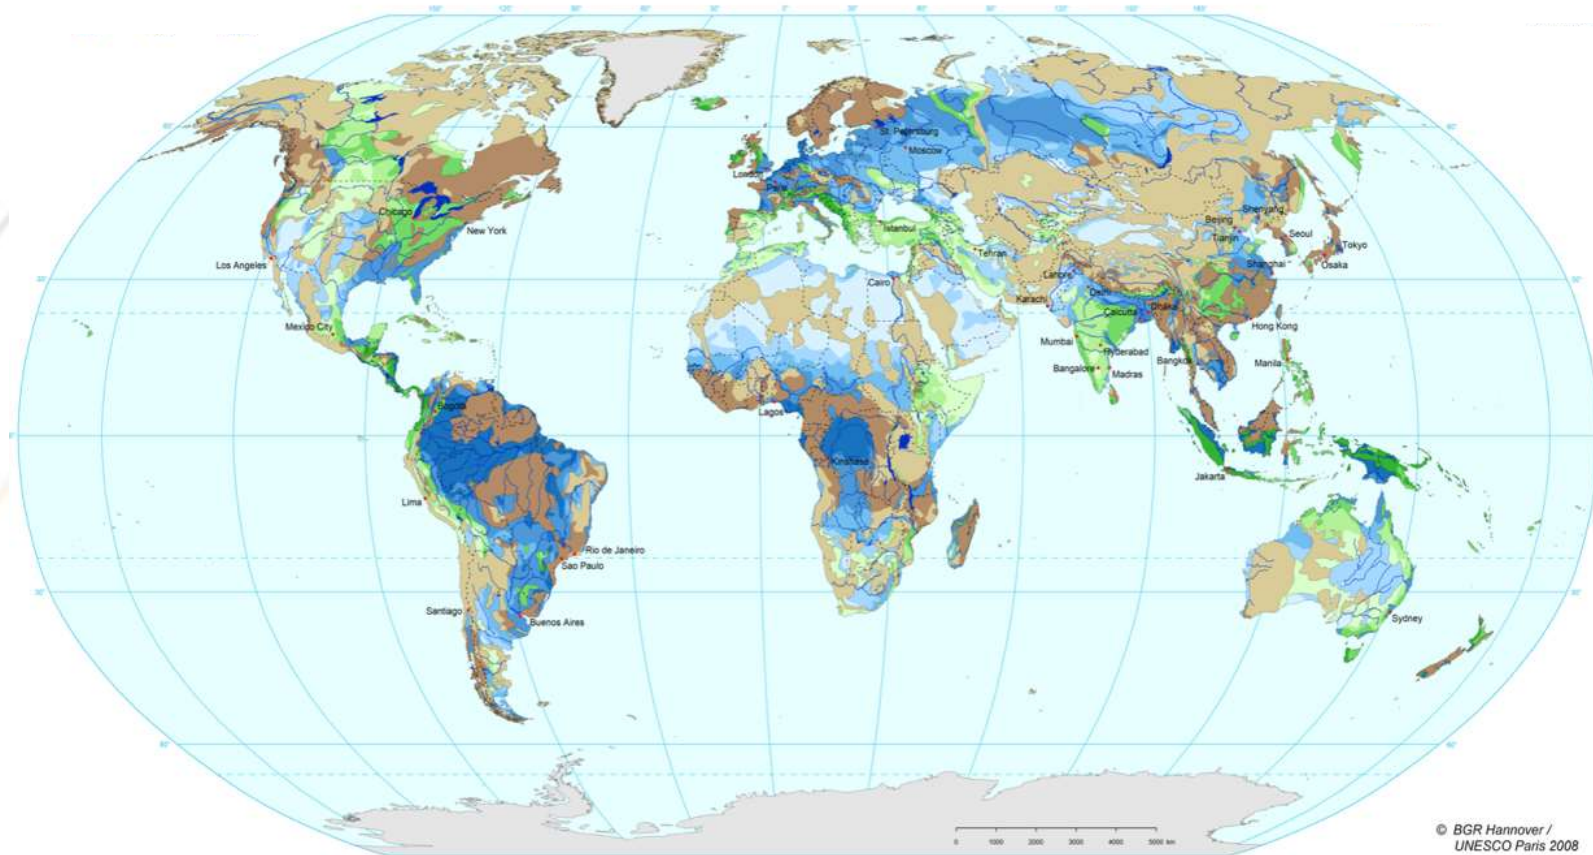

# OVERVIEW OF GROUNDWATER RESOURCES IN THE WORLD

- ✓ Most abundant source of freshwater on earth - approximately 97% of non-frozen fresh water.
- ✓ Approximately 50% of the world's population drinks groundwater daily.
- ✓ Estimated to contribute to over 40 % of the world's production of irrigated crops.
- ✓ Aquifers can also buffer impacts resulting from seasonal variability and climate change.

Groundwater Resources of the World

© BGR Hannover /  
UNESCO Paris 2008

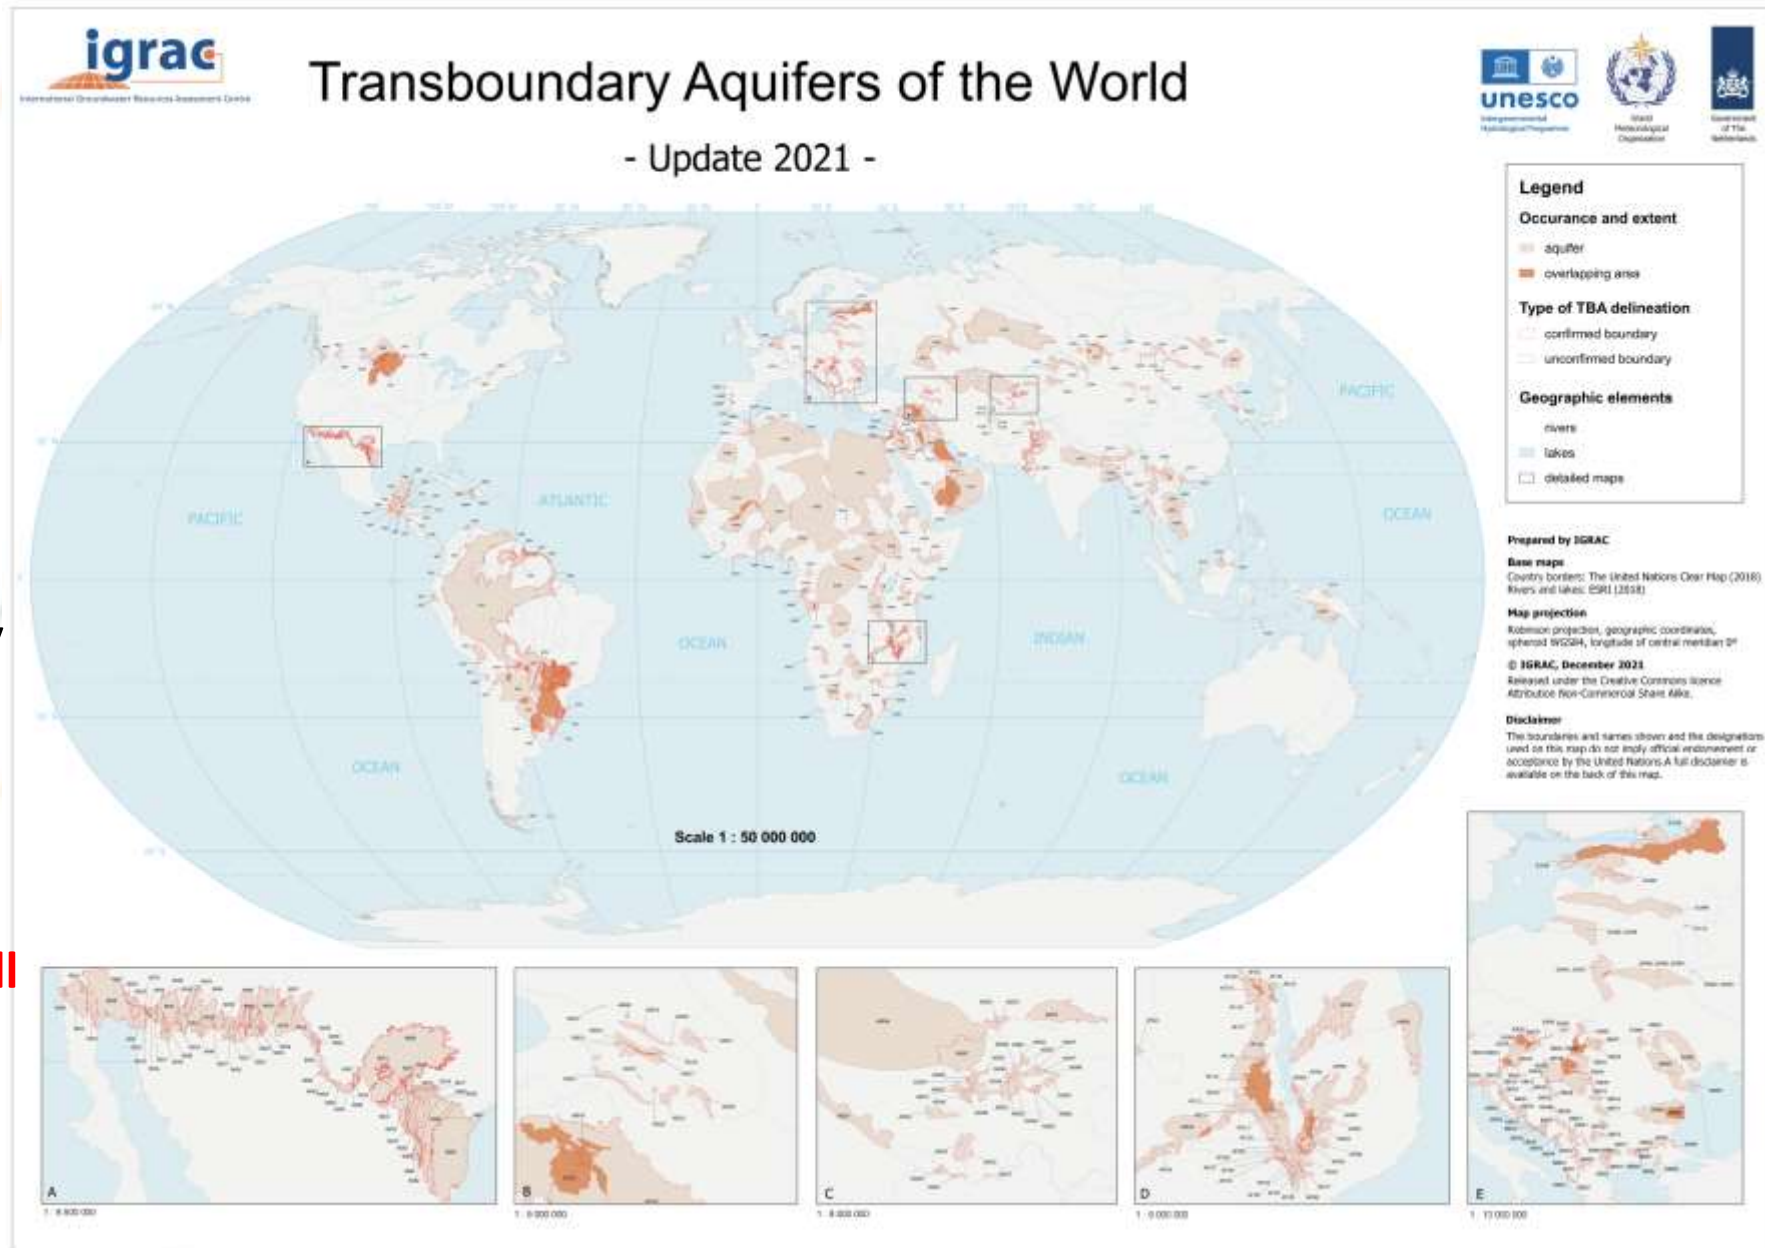

Co-funded by  
the European Union

# 40% OF THE WORLDS AVAILABLE WATER IS TRANSBOUNDARY

- ✓ 468 identified transboundary aquifers
- ✓ New transboundary aquifers will still be identified, and that the delineation of existing ones may be refined by further studies.
- ✓ Assessment of transboundary aquifers is a specific step towards transboundary governance of environmental resources.
- ✓ **Knowledge about transboundary aquifers is still limited.**

Co-funded by  
the European Union

# CHALLENGES

Despite GW importance, this natural resource is **often poorly understood, and consequently undervalued, mismanaged and even abused.**

Groundwater storage depletion = discharge exceeds recharge. Climate variability and climate change play a role, but most cases of long-term depletion due to **intensive abstraction.**

**Groundwater pollution is a virtually irreversible process**

Governance: because groundwater is often perceived as a private resource (that is, closely connected to land ownership, and in some jurisdictions treated as privately owned), **regulation and top– down governance and management are difficult.**  
Governments should have the role as resource custodians.

# Regional perspectives: Sub-Saharan Africa

- **Large groundwater resources.** Not all available for abstraction, but the volume is estimated to be 100 times > of the annual renewal of the region's freshwater resources.
- **About 400 million people in Sub-Saharan Africa still do not have access to even basic water services.**
- Most countries in Western and Central Africa have little groundwater storage but high annual rainfall and therefore regular recharge. Many countries in Eastern and Southern Africa have considerable groundwater storage despite very low levels of recharge.
- Only 3% of the total cultivated land in Sub-Saharan Africa is under irrigation, and only 5% of that is irrigated with groundwater.
- **The development of groundwater could act as a catalyst for economic growth** by increasing the extent of irrigated areas and therefore improving agricultural yields and crop diversity.

# HORN OF AFRICA CONTEXT

Severe drought due to successive failed rainy seasons have impacted the lives and livelihoods of more than 36 million people, with some 20 million facing emergency/catastrophe levels of food insecurity

While human mobility (pastoralists and traders) has traditionally been part of the way of life in the HoA, **limited access to water, loss of livelihoods and drought-related conflict have triggered and reinforced forced displacement and acute levels of food insecurity.**

Although humanitarian interventions continue to be prioritised, the need to develop more sustainable solutions is required to address endless cycle of reacting to multiple crises.

**Increased frequency and severity of droughts** is limiting the ability of communities to recover livelihoods.

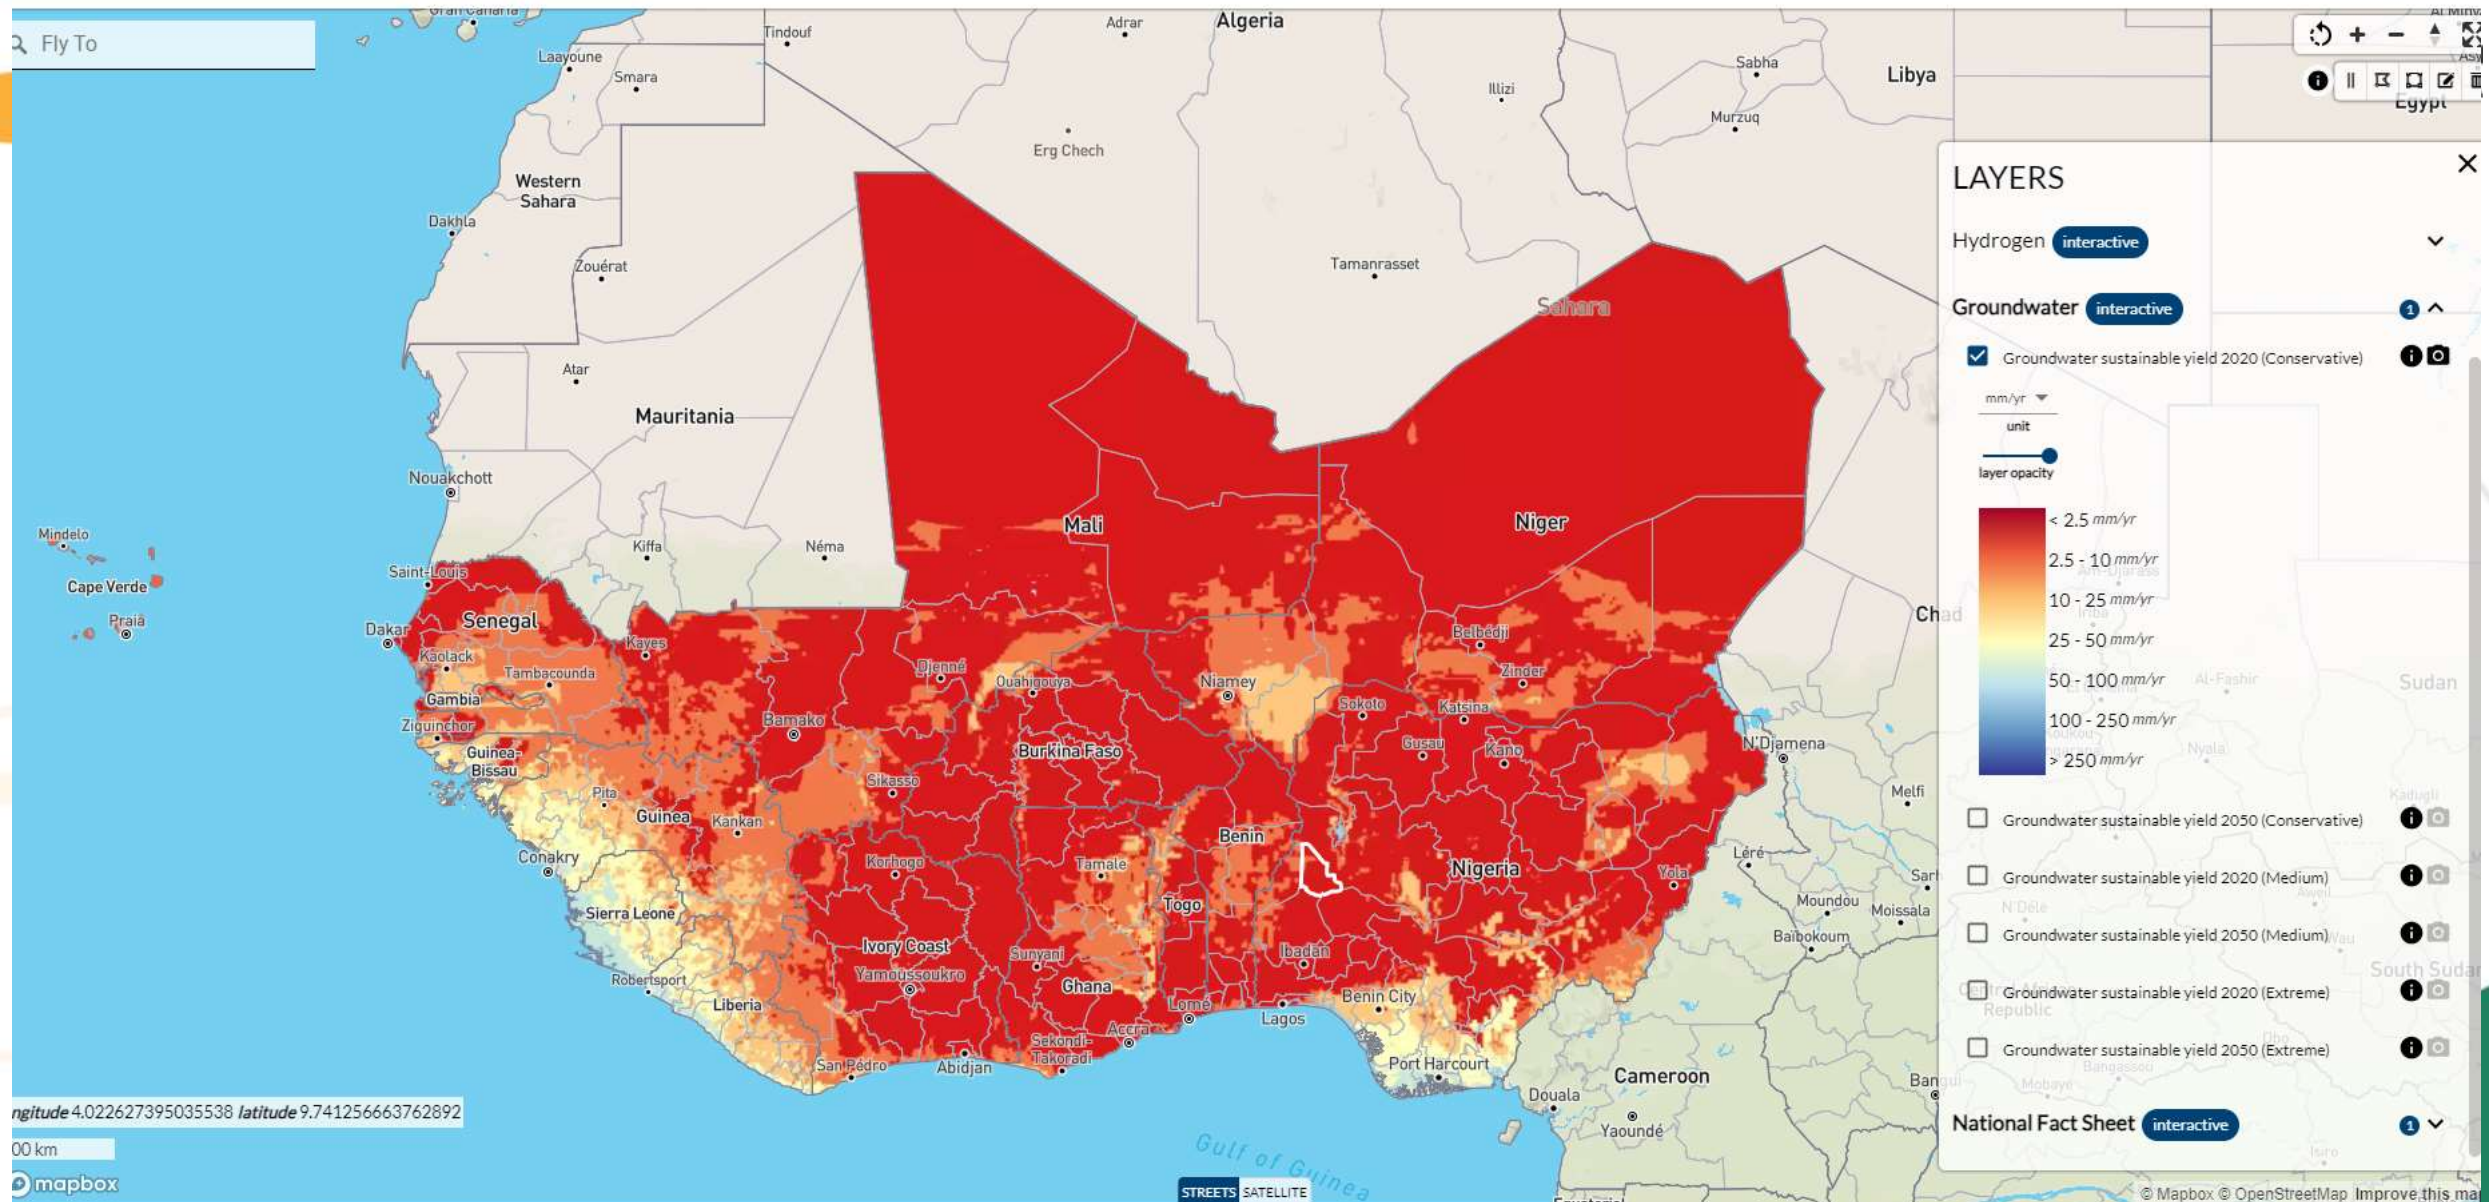

# GROUNDWATER ASSESSEMENT - METHODOLOGY

**Groundwater sustainable yield** = projected groundwater availability for supplementary water usage (including green hydrogen production) after accounting for projected groundwater recharge, environmental flow (% of the simulated recharge) and all projected sectoral water consumptions in the future.

**Groundwater sustainable yield = Recharge – Environmental flow – Human water use**

- The **groundwater recharge** is obtained from simulations of the **Community Land Model** [ver. 5] (CLM5) (Lawrence et al., 2019) at 10 km spatial resolution, forced by CORDEX (<https://cordex.org/>) downscaled RCP2.6 (optimistic) and RCP8.5 (pessimistic) atmospheric scenario projections.
- The **environmental flow** is a certain percentage of the calculated annual recharge, which varies depending on the scenario.
- **Sectoral water use** is obtained from literature (Sutanudjaja, et al., 2018) that takes total water withdrawal for industrial, irrigation, domestic, and livestock into account.

## TABLE OF CONTENT

- Conclusions

**8th edition of the Day of the Liberal Professions 2024  
Conference on Professional Support for the EU Blue Deal  
7th May 2024, Brussels, Belgium**

## CONCLUSIONS (I)

**The region has abundant groundwater.** If this resource is harnessed and well managed has the potential to mitigate drought impact and equip communities to withstand future shock and more important to lead the way towards a more sustainable livelihood for many.

The further development of groundwater in Sub-Saharan Africa is not currently limited by a lack of groundwater, but rather by a **lack of investment in infrastructure, institutions, trained professionals and knowledge of the resource.**

# CONCLUSIONS (II)

- Water is one of the key inputs for a green hydrogen plant.
- It is expected that as the green hydrogen industry comes to fruition as part of the energy transition, **water for hydrogen** is and will become an increasingly important part of the water industry across the world.
- A **holistic approach** to selection of water technologies can make a significant difference in the overall water balance and viability of a project.
- An early, integrated approach to water supply/disposal, power demand and cooling technologies, project location and consideration of carrier technology is needed to identify opportunities to optimise a project's overall site water requirements, and therefore effectively manage and reduce risks associated with sustainable water security and social and environmental concerns.
- While water and water treatment typically do not have a large cost associated with it, finding sustainable water sources and reducing the water consumption for hydrogen production will assist to lead to renewable hydrogen production **obtaining a social licence to operate**
