

Sustainable Consumption: quantitative aspects

Maria Buitenkamp,
Ecostrategy

15 March 2005

Sustainable consumption

The logo for Ecostrategy, featuring the word "ecostrategy" in a stylized font with a leaf-like symbol integrated into the letter "o", and the name "buitenkamp" in a smaller font above it.

WBCSD definition

Eco-efficiency is reached by the delivery of competitively priced goods and services that satisfy human needs and bring quality of life, while progressively reducing ecological impacts and resource intensity throughout the life cycle, to a level at least in line with the earth's estimated carrying capacity

$$I = P * A * T$$

- **I:** environmental impact,
- **P:** population
- **A:** per capita economic activity (affluence)
- **T:** impact per unit of economic activity (technology).

Sustainable consumption:

- Total Impact < carrying capacity of local and global life support systems
- Acceptable Impact :
Environmental (utilisation)
Space or Ecospace.

Sustainable consumption

Crucial impacts

- climate change: 60-80% GHG reduction in 2050
- biodiversity decline (halt 2010)
- decline of fertile land
- availability of clean water
- toxicity and impacts on human health

Most problematic resources

- Animal products and crops.
- Fossil fuels
- Concrete (glass and ceramics)
- Iron and steel (aluminium, lead, copper, nickel and zinc)
- Plastics
- Paper and board

EU-25 + AC3, 1992 - 2000
Normalised and weighted impact scores per capita
reference World95, equal weighting set

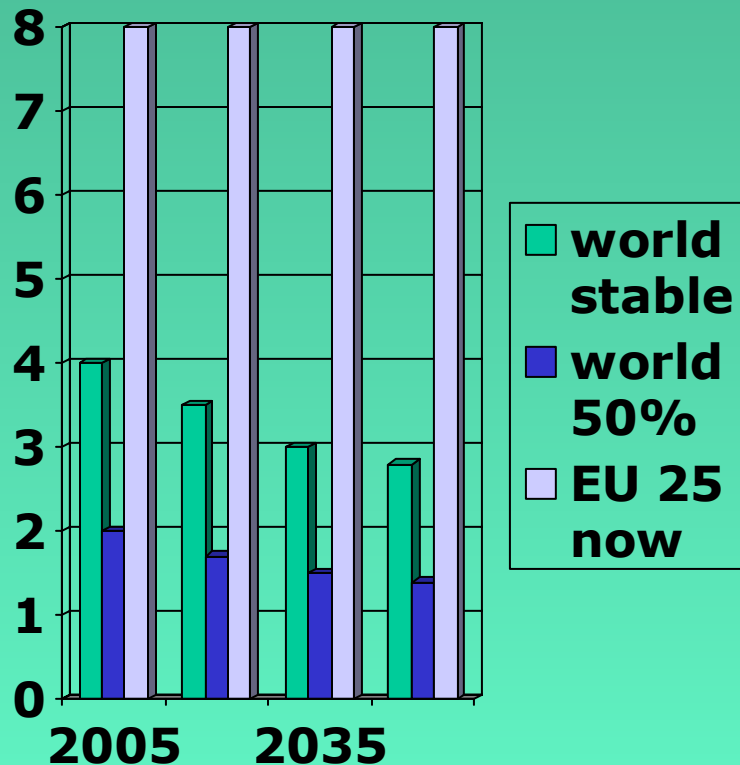

- paper and board
- wood
- animal products
- crops
- fish protein
- sand and stone
- clay
- ceramics
- concrete
- salt
- glass
- zinc
- nickel
- lead
- iron and steel
- copper
- aluminium
- plastics
- soft coal for electricity in households
- soft coal for heating in households
- hard coal for electricity in households
- hard coal for heating in households
- oil for electricity in households
- oil for households
- natural gas for electricity in households
- gas for households

Sustainable consumption

Population growth and economic convergence: CO2

- Average CO2 p.p:
- Stabilising emissions
- Halving emissions
- Please note: numbers are a rough estimate for illustration

The copier example

- XEROX office department copier/printer/fax, 84,000 copies per year, used by 5 – 20 people, 5 year lifetime.
- 1999-2010: increase from 0.8 to 3.5 million machines in use
- 1999-2010: 10% more paper use

Copier: results of growth in affluence and market developments in 2010

- 4.4 - fold increase in machine related resources used
- 4.8 - fold increase in paper use
- 4.7 - fold increase in energy use

The 2010 sustainable copier challenge

- Stabilise impacts: 75-80% reduction needed
- Reduce impacts: 90% reduction

Resource use of a copier

| World population 7 billion | Sustainable use per person per year | Resource use for one copier per year |
|-------------------------------|---|--|
| Iron ore | 50 kg | 40.6 kg |
| Fossil energy | 25 GJ | 24 GJ |
| Renewable energy | 35 GJ | 0.6 GJ |
| Wood | 200 kg | 336 kg |

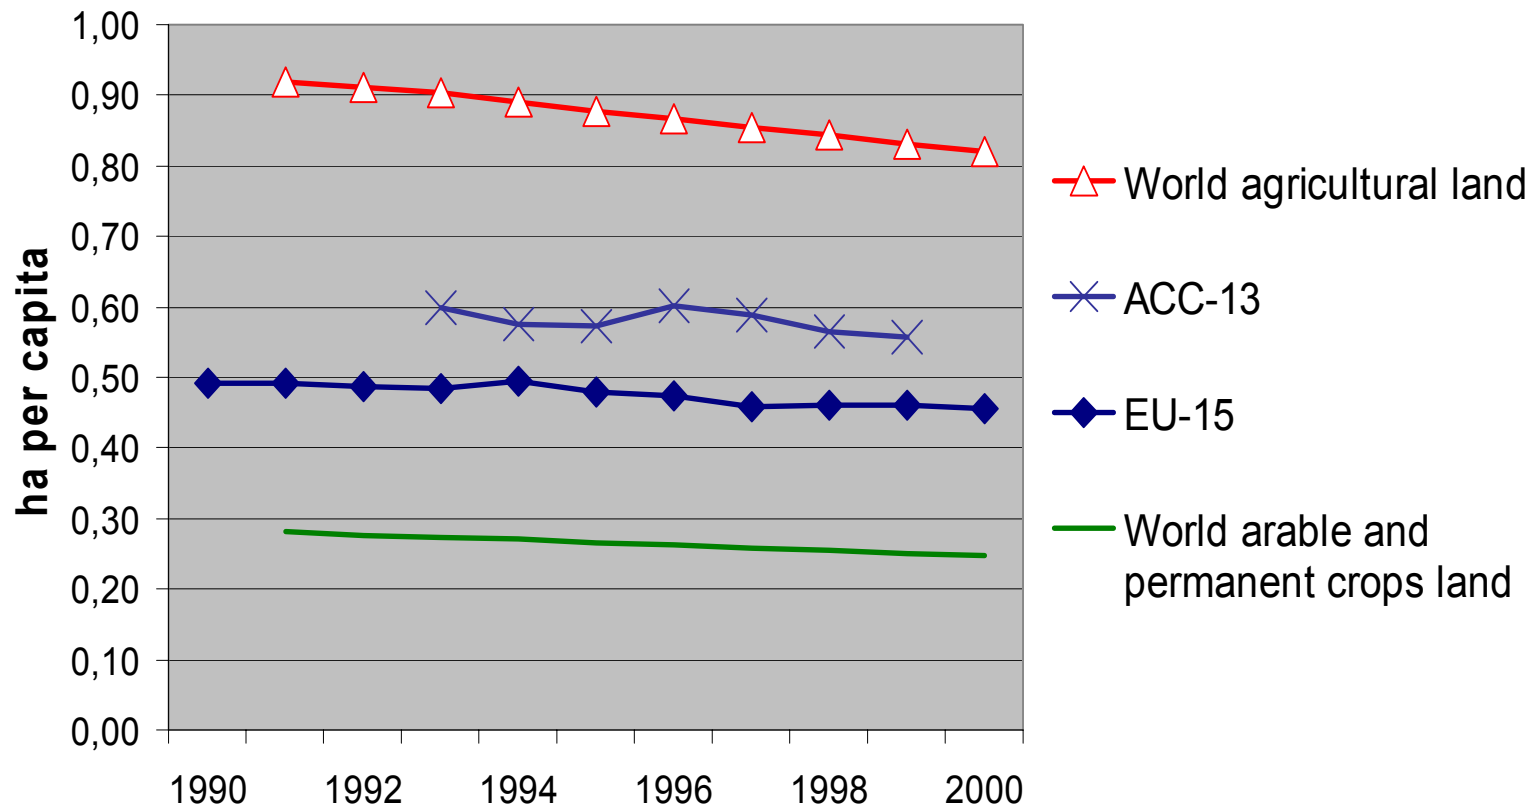

Options to meet the challenge

- expanding the life-time
- re-use and recycling of machine parts
- use of recycled paper
- use of renewable energy sources
- system innovations such as rewritable (electronic) paper?

Recommendations

- global perspective
- economic convergence (China, India)
- assess carrying capacities
- define standards and objectives for sustainable use of resources
- providers of goods and services also have a responsibility to respect carrying capacities
- economic convergence and population growth alone point in the direction of 80% reduction
- the recommendations from Ostend, Nov. 2004
